

Hikvision → Odoo Attendance

Quick Setup Guide (read this when you come back)

Updated: July 07, 2026

Folder: scripts\hikvision_attendance_service

What is this?

A small Python program on your Windows PC receives fingerprint events from the Hikvision device and creates check-ins in Odoo Attendances on Odoo.sh. You do NOT configure anything inside Odoo for the fingerprint device itself.

Flow: Fingerprint on device → PC bridge → Odoo.sh attendance record.

Your machines (write these down)

What	Address
Hikvision device	192.168.100.85
Bridge PC (this PC)	192.168.100.4
Bridge URL	http://192.168.100.4:8080/hikvision/attendance
Odoo.sh	https://shamsieh-testing-33874628.dev.odoo.com
Odoo database name	shamsieh-testing-33874628

Start the bridge (every time)

Open PowerShell:

```
cd C:\Users\ASUS\Desktop\odoo\scripts\hikvision_attendance_service
.\.venv\Scripts\Activate.ps1
uvicorn app.main:app --host 0.0.0.0 --port 8080
```

Leave the window open. Test in browser:

- <http://127.0.0.1:8080/health> → {"status":"ok"}
- <http://127.0.0.1:8080/odoo/ping> → {"status":"ok"}

Auto-start on Windows login

Already installed to:

- C:\Users\ASUS\AppData\Local\HikvisionAttendanceBridge
- Scheduled task name: HikvisionAttendanceBridge

Restart task: Start-ScheduledTask -TaskName HikvisionAttendanceBridge

Hikvision device settings

Configuration → Network → Advanced → HTTP Listening:

Field	Value
Event Alarm IP	192.168.100.4
Port	8080
URL	/hikvision/attendance
Protocol	HTTP

Important: The device must send authentication events, not only door status. If you only see subEventType 21–24 in logs, enable access/authentication events in the device event settings.

Odoo employee setup (required)

For each person on the fingerprint device:

- Open Employees → select person
- RFID/Badge Number = same number as on Hikvision (example: 5 for MohammadNoor)
- Biometric Device User ID = same number (recommended)

Example verified: MohammadNoor (employee id 3) with barcode 5 matches device employeeNoString 5.

Odoo login for the bridge (.env file)

The bridge uses XML-RPC + API key. It does NOT use PostgreSQL.

File: scripts\hikvision_attendance_service\.env

Variable	Value
ODOO_URL	https://shamsieh-testing-33874628.dev.odoo.com
ODOO_DB	shamsieh-testing-33874628
ODOO_BOT_USER	Your Odoo login email (e.g. m.saqr@shamsieh.com)
ODOO_API_KEY	From Odoo → Preferences → Account Security → New API Key
LISTEN_PORT	8080
VERBOSE_LOGGING	true = see every device event in console

If /odoo/ping fails: wrong email or API key. Generate a new API key while logged in as that user.

What the device sends (event types)

subEventType	Meaning	What happens
38 or 150	Fingerprint / auth SUCCESS	Creates attendance in Odoo (if barcode matches)

39 or 151	Fingerprint / auth FAILED	Logged as fingerprint-failed; no Odoo record
21-24	Door / system noise	Ignored (door locked, unlocked, etc.)

Success log looks like:

employee_no='5' subEventType=38 statusValue=1 → Created attendance id=...

Failed log looks like:

employee_no=None subEventType=151 statusValue=0 → wrong finger or not enrolled on device

Webhook responses (JSON body)

The device always gets HTTP 200 or 201 (so it stops retrying). Read the JSON reason field to know what happened:

reason / result	Meaning
created (HTTP 201)	Check-in created in Odoo
duplicate-attendance	Already checked in today
duplicate-event	Same event already processed
employee-not-found	Barcode not set in Odoo for that employee number
fingerprint-failed	Device rejected the scan
system-event	Door event — ignored
odoo-unavailable	Odoo down — queued for retry

Troubleshooting cheat sheet

Problem	Fix
Only subEventType 21-24 in logs	Device not sending auth events — check Hikvision event settings
subEventType 151, no employee_no	Fingerprint failed on device — re-enroll finger
employee-not-found	Set RFID/Badge Number in Odoo = device employee ID
Odoo connection failed	Fix ODOO_BOT_USER (email) and ODOO_API_KEY in .env
Same event repeats forever	Restart bridge (latest code returns 200 to ACK events)
Nothing in Odoo server logs	Normal — bridge talks via XML-RPC from your PC, not Odoo web

Test without the device

PowerShell (tests MohammadNoor barcode 5):

Invoke-RestMethod -Method POST -Uri http://127.0.0.1:8080/hikvision/attendance -ContentType application/json
-Body

```
{ "subEventType": 38, "employeeNoString": "5", "currentVerifyMode": "fp", "status": "success", "statusValue": 1, "dateTime": "2026-07-07T15:00:00+03:00", "serialNo": 99999 }
```

Regenerate this PDF

```
cd scripts\hikvision_attendance_service
```

```
.\venv\Scripts\pip install python-docx docx2pdf
```

```
.\venv\Scripts\python doc\generate_documentation.py
```

```
Output: c:\Users\ASUS\Downloads\Hikvision_Odoo_Attendance_Bridge.pdf
```
